SECRETS to a TERRIFIC TECHNICAL TALK

THINGS ANYBODY CAN DO
(and should)

Betty Lise Anderson
The Ohio State University
ORGANIZATION (of this talk)

- Planning
- Preparing
- Presenting
- VISUAL AIDS!!!
- Conclusions
A TALK IS NOT A PAPER

- Cannot cover everything
- Cannot go into the same detail
- Make hard decisions about content
- Time required is roughly the same
  - For a paper, time is in the writing and editing
  - For a talk, time is in the planning and practicing!
HEARING vs. READING

HEARING

» Linear
» Hear everything once
» Depend on speaker to make organization clear
» Speaker must repeat key points

READING

» Skip around
» Can reread hard parts
» Depend on headings to make organization clear
» Reader finds key points in abstract, conclusions

http://www.itsessential.ca/itsessential/display_page.asp?page_id=323&print=1

© Betty Lise Anderson The Ohio State University 2009
Hearing vs. Reading cont.

λ HEARING

» Once lost, listener cannot recover
» Pace set by speaker
» People may zone if you’re dull or confusing, but they’ll try to recover at your Conclusions

λ READING

» If lost, go back and reread hard parts (or pitch article)
» Pace set by reader
» Some people skim, or read only abstract, or conclusions, or only look at the pictures...
Speaker controls the flow of information

- Not like a paper, where reader controls it
- Therefore, **ORGANIZATION** and **PLANNING** are key
Don’t ask “What am I going to talk about?”

ASK **WHY?**

- Inform or instruct (e.g., at a conference)
- Persuade or sell (dissertation defense)
- Arouse interest (hire me!)
- Inspire or initiate action (fund me!)
- Evaluate, interpret, clarify
- Gather ideas/lead discussion
- Entertain

EVALUATE YOUR AUDIENCE

- Technical? Students? Lay people?
- More informed or less informed than you?
- Why are they there? What do they want?
Where? When?

- What kind of a room? Big, small, loud, hot, dark, hard to find…
- Audio visual equipment? What do you need, and what is your backup?
- Stage? Microphone? Should you bring a pointer?
- Early in day? End of day? Right after lunch???
Check it out in advance

- Make sure projector works and has a spare bulb
- Learn how to use microphone
- If using a computer, make sure it works
  » ... and have a backup!
- Decide where you’ll stand, what kind of pointer you’ll use, where you’ll set your stuff
Now, gather information

IT WON’T ALL FIT!
How should you organize?

According to the material
» In order of discovery?
» In order of cost?
» In order of difficulty?

According to the audience
» Start with simple case
» Build up complexity
» Relate materials to what they already know

COMBINATION
WRITE AN OUTLINE

- Is everything in it necessary? Is everything in it important?
- Will the audience understand each idea, or does it need a background slide to explain it?
- Will anything you’ve included raise questions you’re not prepared to answer?
- Have you made and repeated your key points?
- Will it fit into the time allowed?
EVERY TALK SHOULD HAVE

- Title slide
- Organization slide
- Good stuff in the middle
- Conclusions slide
Title slide

Should contain:
» Title of talk
» Authors and co-authors
» Organization
» Sponsors

When presenting:
» Read or paraphrase the title
» Pronounce everybody’s name
» Say who you are
» Thank sponsor (if applicable)
SECRETS to a TERRIFIC TECHNICAL TALK

THINGS ANYBODY CAN DO
(and should)

Betty Lise Anderson
The Ohio State University
Next make an organization slide

- Organization of your talk
- Helps audience figure out what your scope is
  - Theoretical?
  - Experimental?
  - Speculative?
- Give you a chance to say your key point for first time
Why use lasers in fiber optics?
Review of LED’s, lasers, and light bulbs
Theory showing lasers are brighter
Experimental data
Conclusions

My key point
ALWAYS Start with big picture

- Explain the problem you’re trying to solve
- Explain how it fits into big scheme of things
- Approach you took and why
Are they lost yet?

- Remember: if you jump right into your results without the big picture, you’ve lost your audience.
- Once you’ve lost them, you won’t get them back until your final slide.
- If then.

Repeat your key points

- Tell ‘em what you’re going to tell ‘em, tell ‘em, then tell ‘em what you told ‘em.
- State key points at beginning and end and any chance you get in the middle
- Use short, internal summaries:
  - “I’ve just shown that the equations predict a laser is brighter than a light bulb; now I will present the experimental data …”
Make your visuals

More on this later...
PRACTICE YOUR TALK

- Do it out loud.
- With the visuals.
- Time it.
- Decide what to cut out.
Practice it again.

- And again.
- Wait a day or two.
- Practice it again.
- Practice it again the night before you give it.
- Time it every time.
The worst mistakes (and most common)

- No big picture.
- Crappy slides.
- Too long.
- Didn’t practice.
- Can’t follow.
- Didn’t reiterate key points
VISUAL AIDS

This is the problem.
SOLUTIONS:

- USE THE HORIZONTAL FORMAT!!!!
- USE LARGE TYPE
- LIMIT THE AMOUNT OF INFORMATION PER SLIDE
  » Keep key points away from bottom
- STATE YOUR POINT
- KISS (keep it simple, stupid!)
Compare:

Once upon a time
in Arkansas
An old man sat in his little cane door
He talked at a
tune he liked to hear
A jolly little tune
that he played by ear.
It was making so hard
But the fiddle didn't care
and away
I'll never fall

Lasers are good
Then an bright
Reliable
Elegant
Simplifying slides

- Get rid of anything you won’t talk about
- Makes lines fat, type bold
- Make sure the point you want to make is on the slide
  - What is the one thing (one idea) you want your audience to get?
  - If you don’t know what the point is, you don’t need the slide
Bad

RESPONSE FUNCTION OF WIDGET

\[ \mu \]

Displacement (mm/%RH)

Good

First zero at 37: matches prediction
Mirror B

Mirror C

input turning mirror

auxiliary mirror

central beamsplitter

control beam

scanning slit

liquid crystal light valve

polarizing beamsplitter

output lens

signal detector

oscilloscope

semitransparent mirror

reference detector

gating device

in from 3 mW Argon laser

© Betty Lise Anderson The Ohio State University 2009
But...

- Can study a paper, can view slide only for short time
- Too many details: viewer stops listening while trying to figure out figure
- Viewer panics because can’t comprehend figure before you take it down
To fix:

- Remove all ancillary stuff
  - Remove power supplies, non-critical components, labels, arrows if possible
  - Strip figure down to bare bones
- Make lines bold!
- Simplify, simplify, simplify.
- Use color to make things stand out or group like objects
Better for a talk.
BAD

The Advantages of Fiber Optics:

1. They are cheaper than wire for most installations
2. Fiber optics are more durable and last longer than copper wire since they are not susceptible to corrosion.
3. Fibers are difficult to tap.
4. Fibers are insensitive to electromagnetic interference (EMI) such as lightning or machine noise.
5. Fiber optics have higher bandwidth than copper wire, so more information can be transmitted per second.
6. Fibers are less sensitive to nuclear radiation. Fiber systems are expandable once installed by using wavelength-division multiplexing on existing fibers.

Disadvantages:
1. Fibers are sharp and could put your eye out.
2. Fibers are not cost-competitive in some applications. For example, it is not usually worthwhile to lay fiber to the home while it is cost effective to lay fiber in the loop.
3. Fibers are difficult to splice because of alignment problems and the need to have good cleaves on both surfaces. They can’t be soldered like wire.
4. Fibers make ridiculous wigs and tacky lamps.

λ Too many ideas
λ Too small
   » (that was 12-point, standard for typing)
λ Serif font
   » (great for reading on a page, bad for slides)
λ Long sentences
λ Audience stops listening because they’re trying to read this
Serif and non-serif fonts

- Serifs help carry the eye along lines of text—great for pages of text
- Non-serif fonts better for single words, phrases
- Notice billboards always use non-serif fonts.

The Ohio State University

Serif fonts:
» Times
» Palatino
» Courier

Non-serif fonts:
» Helvetica
» Geneva
» Arial
To fix busy slide

The Advantages of Fiber Optics:

- Break up into more than one slide
- Use big fonts
- Use non-serif font like this one
- Capture each thought in a phrase

1. They are cheaper than wire for most installations
2. Fiber optics are more durable and last longer than copper wire since they are not susceptible to corrosion.
3. Fibers are difficult to tap.
4. Fibers are insensitive to electromagnetic interference (EMI) such as lightning or machine noise.
5. Fiber optics have higher bandwidth than copper wire, so more information can be transmitted per second.
6. Fibers are less sensitive to nuclear radiation.
Fiber systems are expandable once installed by using wavelength-division multiplexing on existing fibers.

Disadvantages:

- Fibers are sharp and could put your eye out.
- Fibers are not cost-competitive in some applications. For example, it is not usually worthwhile to lay fiber to the home while it is cost effective to lay fiber in the loop.
- Fibers are difficult to splice because of alignment problems and the need to have good cleaves on both surfaces. They can’t be soldered like wire.
- Fibers make ridiculous wigs and tacky lamps.
Advantages of Fiber

- Cheaper
- Durable
- Can’t tap
- No EMI
- High bandwidth
- Radiation-hard
- Expandability (e.g., WDM)
Disadvantages of fiber

- Sharp (potential eye damage)
- Not always cost-effective
- Difficult to splice
- Image problems
Once upon a time in Arkansas, an old man
Sat in his little cabin door, he fiddle at a tune
He liked to hear, a jolly little tune that he
played by ear.
Suppose they have to see more than one thing at once

- Will help to see this graph while discussing equation

\[
|d| = \begin{vmatrix}
3 & 7.54 & 19 \\
\pi & \omega & 12 \\
-17 & 6 & x
\end{vmatrix}
\]
Then show them one first

- Here are my main points about the graph
- Audience gets familiar with while I’m talking
- Then show it again, adding the equation
Now they don’t need to see it in as much detail

- Graph is there, but smaller—they can refer to it
- Equation is now main point, and they can see it well

\[
|d| = \begin{bmatrix}
3 & 7.54 & 19 \\
\pi & \omega & 12 \\
-17 & 6 & x
\end{bmatrix}
\]
If you are difficult to understand...

- Speech impediment?
- Not giving talk in your native language?
- Then, by all means, put more words on your slides
- Key is to be understood

Ouviram d’Ipiranga das margens plácidas
D’um povo heroico
brado retumbante.
Presenting Equations

- Do you have to?
- What can you say about equation that audience will really get?
- What point are you trying to make using the equation?
Example

\[ \mu_{12} = \gamma_{12}(0) = e^{ik\left(\frac{x^2 + y^2}{2z}\right)} \frac{1}{z^2} \int\int_S J(\nu_x, \nu_y) e^{-ik(n_x x + n_y y)} d\nu_x d\nu_y \]

- Screw the phase constant (not important)
- Don’t define two things at once
- Who cares about normalization constant?
- What is the IDEA behind this?
Better way:

\[ \mu \propto \left\{ \int \int_{S} J(v_x, v_y) e^{-ik(v_x x + v_y y)} \, dv_x \, dv_y \right\} \]
Presenting plots

- Keep them simple
- Read the axes out loud
- Tell audience what you’re looking for
- Point it out to them
- Tell them whether it’s good or bad
Normalized SEP – E-plane Scans

- Normalized so max value across any frequency cut is zero
- Beamwidth of SEP shows scan volume vs. frequency
- Angle scans in azimuth

No evidence of scan blindness!

Courtesy Paul Friedrich, GTRI
Periodic Array - Design Prediction

Design Incorporates:
- One driven and two parasitic Face Sheet layers
- Multi-layer r-card screen

Performance:
- ~1 dB or better from 5-10 GHz
- Better than 3 dB from 300 MHz – 10 GHz

Multi-Layer Fragmented Radiators Key to Performance at Upper End (Better than 1 dB Insertion Loss)

Courtesy Paul Friedrich of GTRI
Complicated Plots

- As with any complicated stuff:
  - Start with easy idea
  - Gradually add complexity, explaining each step
    - Slides are cheap! (when I was young…)
  - Build up to complete plot
  - Explain what you’re looking for
  - Point it out
Suppose you want to present:

Start with this:

Then add other parts

Use of Color

Find the round things

Find the pink things
Use color to relate things
Another example
Animations can be really irritating!!

- Wastes time
- Shows you don’t have enough to do
- Spend your time on the content!
- Too much glitz weakens your presentation (especially among engineers!)
But they can be very effective, too
But they can be very effective, too

- In this case- shows clearly what’s different
- Builds up complexity gradually
CITATIONS

- You MUST cite all non-original material
- Remember, the person who wrote that paper might be in the audience
- Or her best friend…
- Or one of his students…
CITATIONS continued

- If you REPRODUCE it (photocopy or scan), cite FULLY on the slide

- If you REDRAW or modify it, say “After” and cite it FULLY on the slide

The dreaded Question and Answer period
Relax, it’s not that bad

- People are on your side (really!)
- You’ll know answers to 80% of ?’s
- OK to say “I don’t know”
  - “I haven’t looked into that aspect.”
  - “I’m not familiar enough with the piezoelectric devices to give you a good answer.”
  - “That’d be an interesting question to look into.”
  - “I don’t know, but maybe someone else here can answer that.”
How about that nasty guy?

- Happens rarely
- Makes everybody mad - they’ll side with you
- What does he REALLY want?
  - Wants to show what he knows?
  - Wants to hear himself talk? (sometimes an answer isn’t necessary, just an acknowledgment)
  - Genuinely wants to put you down? (very rare)
Traps to watch for:

- Hypothetical question:
  » “Suppose I used your device to jack up my car. What would happen?”
- You don’t have to answer it! How should you know?
- Response: “I don’t know. I haven’t looked into that application.”
- Don’t BS. Don’t guess. Don’t speculate.
Loaded preface:

- “Given the deservedly low regard for…”
- “Do you mean to tell me…”
- “Since all you big companies get together to set your prices…”
- Don’t ignore it, address it: “I’d be happy to address your question, but first let me address your allegation…”

Terry C. Smith, “Making Successful Presentations, Wiley 1984"
Loaded words

- Failure, overrun, delay, swindle, too (small, impractical, expensive)
  » “The poor design of your laser makes it impractical for jacking up cars…”

- Reword the question
  » “The question was, why was the laser made from a semiconductor chip instead of industrial steel”

Go from defense to offense

- “Clearly we have a difference of opinion here…”  

- If they won’t drop it, offer to discuss it privately after the session
  » Makes it easier for you to blow them off
  » Makes it so no one else overhears
  » Doesn’t waste audience’s time
Your behavior

- Try not to sway, fidget, rap the screen, click your pen, jingle your change
- Do not ignore interruptions, acknowledge them
- Do not apologize for bad slides, unclear pictures…
- Do not read from a script (if you can help it)
Laser Pointers

- Point to what you’re talking about
  » Especially if you’re hard to understand
- Don’t wave it wildly
- Don’t turn it on and off too quickly
- Let people see the point, then follow it to your point
Do:

- Smile (puts people at ease)
- Make eye contact (makes them pay attention)
- Take a deep breath before starting
- Pause for effect
- Show enthusiasm
- Repeat your key points
- Repeat your key points
Finally...

- Remember to state your key points more than once
- Short, internal summaries
- Tell 'em what you’re going to tell ‘em, tell ‘em, tell what you told ‘em
- Be sure to summarize your keys points

Be sure to spell-check your slides
I lied, we aren’t done yet

"and in conclusion..."
Conclusions:

- A talk is not a paper
- Can’t cover everything
- Restate your main points in different ways
- Simplify your slides
- Practice your talk
